

Feeding Guidelines

Recovery is suitable for rabbits, guinea pigs, chinchilla, degus and other small herbivores that require a high fibre diet. Mix one sachet or three level scoops (20g), of Recovery with 70ml of warm water per kg of bodyweight per day. Feed small amounts at regular intervals throughout the day. Guinea Pigs and Degus will require vitamin C supplementation.

Instructions

- 1) Mix the sachet with 70ml of warm water and mix thoroughly to achieve an even suspension
- 2) Draw a manageable amount into the syringe
- 4) Place the animal on your lap with its head facing away from your body
- 5) Place nozzle of the syringe into the side of the mouth and gently squeeze a small amount at a time to the back of the mouth
- 6) Allow the animal to swallow between mouthfuls - gently rubbing the throat will encourage this and you will get used to the amount that your animal will take in each mouthful
- 7) Continue feeding until a sufficient amount has been eaten - this may only be small to begin with – and gradually increase the daily feed as the animal gains strength
